UNDERWATER OBJECTS DETECTED IN CUBA

1. A study was made of the underwater objects located within the Gulf of Batabano (22 00N-82 00W) Cuba in order to identify and determine the nature and purpose of the objects.

2. The study revealed the following information:

a. Two large seismic patterns (probably petroleum exploration) approximately 33 nm long and 36 nm wide located between geographic coordinates 21 45N to 22 20N and 81 35W to 82 10W.

b. One pattern consists of at least 19 parallel rows of single shot seismic holes oriented N/S and at least 11 parallel rows of single shot seismic holes oriented E/W which cross the N/S rows at right angles.

c. The other pattern consists of 2 parallel rows of four shot seismic holes (referred to as rectangular objects) oriented N/S (located between the N/S single shot seismic holes), 6 parallel rows of four shot seismic holes oriented E/W (located between the E/W single shot seismic holes) which cross the N/S rows at right angles and one diagonal row of four shot seismic holes oriented NW/SE which intersects the entire four shot pattern.

ENCLOSURE:

One map overlay (CIA/PID/GMB/P-1909/65).
